

# Driver Station Dashboards Using HTML + Javascript

Dustin Spicuzza  
September 10, 2016

NE FIRST University Day

# Agenda

- History + Alternatives
- Why HTML + Javascript
- How it works
- Getting started
- Real dashboard code
- Demos

# Intended Audience

- Some familiarity with a browser
- Some programming experience
  - If you don't... that's ok too

# Who Am I?

- Software engineer at BBN Technologies
- Mentoring FRC since 2009
- Co-maintainer of RobotPy since 2010
- My team's UI-related awards:
  - 2012 Boston Regional; Innovation in Control
  - 2013 Boston Regional; Innovation in Control
  - 2014 Virginia Regional; Industrial Design
  - 2015 Greater DC Regional; Innovation in Control
  - 2016 Chesapeake Champs; Innovation in Control

# Who Am I?

- Software engineer at BBN Technologies
- Mentoring FRC since 2009

# Dashboards

- Back in the day...
- Lots of options now
  - LabVIEW Dashboard
  - SmartDashboard/SFX
  - Custom (Java, C#, et al)

# Dashboard Applications

- Robot Control by secondary operator
  - Click a button, make something happen
- Set up autonomous mode
  - Makes it easy to switch between different mode settings on the fly

# Dashboard Applications

- Tuning the robot
  - Changing positions dynamically
  - Better than constant code redeploy!
- Providing visual feedback for sensors
  - Good for debugging hardware issues

Dashboards

**MY JOURNEY**

# My Journey: 2009/2010

## WebDMA (C++)

**WebDMA Control Panel**

<b>LF Servo</b> P <input type="text" value="0.75"/> I <input type="text" value="0.00"/> D <input type="text" value="0.00"/> Setpoint <input type="text" value="0.00"/> StopRange <input type="text" value="3.00"/> Scale <input type="text" value="10.00"/> Offset <input type="text" value="3.00"/> Current Angle 357.00	<b>RF Servo</b> P <input type="text" value="0.75"/> I <input type="text" value="0.00"/> D <input type="text" value="0.00"/> Setpoint <input type="text" value="0.00"/> StopRange <input type="text" value="18.00"/> Scale <input type="text" value="10.00"/> Offset <input type="text" value="7.00"/> Current Angle 353.00	<b>LR Servo</b> P <input type="text" value="0.50"/> I <input type="text" value="0.00"/> D <input type="text" value="0.00"/> Setpoint <input type="text" value="0.00"/> StopRange <input type="text" value="3.00"/> Scale <input type="text" value="25.00"/> Offset <input type="text" value="2.00"/> Current Angle 358.00	<b>RR Servo</b> P <input type="text" value="0.50"/> I <input type="text" value="0.00"/> D <input type="text" value="0.00"/> Setpoint <input type="text" value="0.00"/> StopRange <input type="text" value="3.00"/> Scale <input type="text" value="25.00"/> Offset <input type="text" value="-5.00"/> Current Angle 5.00

# My Journey: 2009/2010

## WebDMA (C++)

- Not actually a dashboard
- Ran an in-process webserver on the cRIO
  - UI was HTML/JS
- Great for tuning

# My Journey: 2012

## Custom SmartDashboard widget (Java)

- Show ball when sensor is on

But...

- Little/poor documentation
- Java swing is complicated
- Layout is terrible
- Hard to setup

# My Journey: 2013/2014

PyGTK + touchscreen laptop

# My Journey: 2013/2014

PyGTK + touchscreen laptop

- Very shiny
- Integrated with image processing
- Communications via pynetworktables

But...

- Python is great, GTK is not
- Difficult to customize interface
- Very difficult to teach

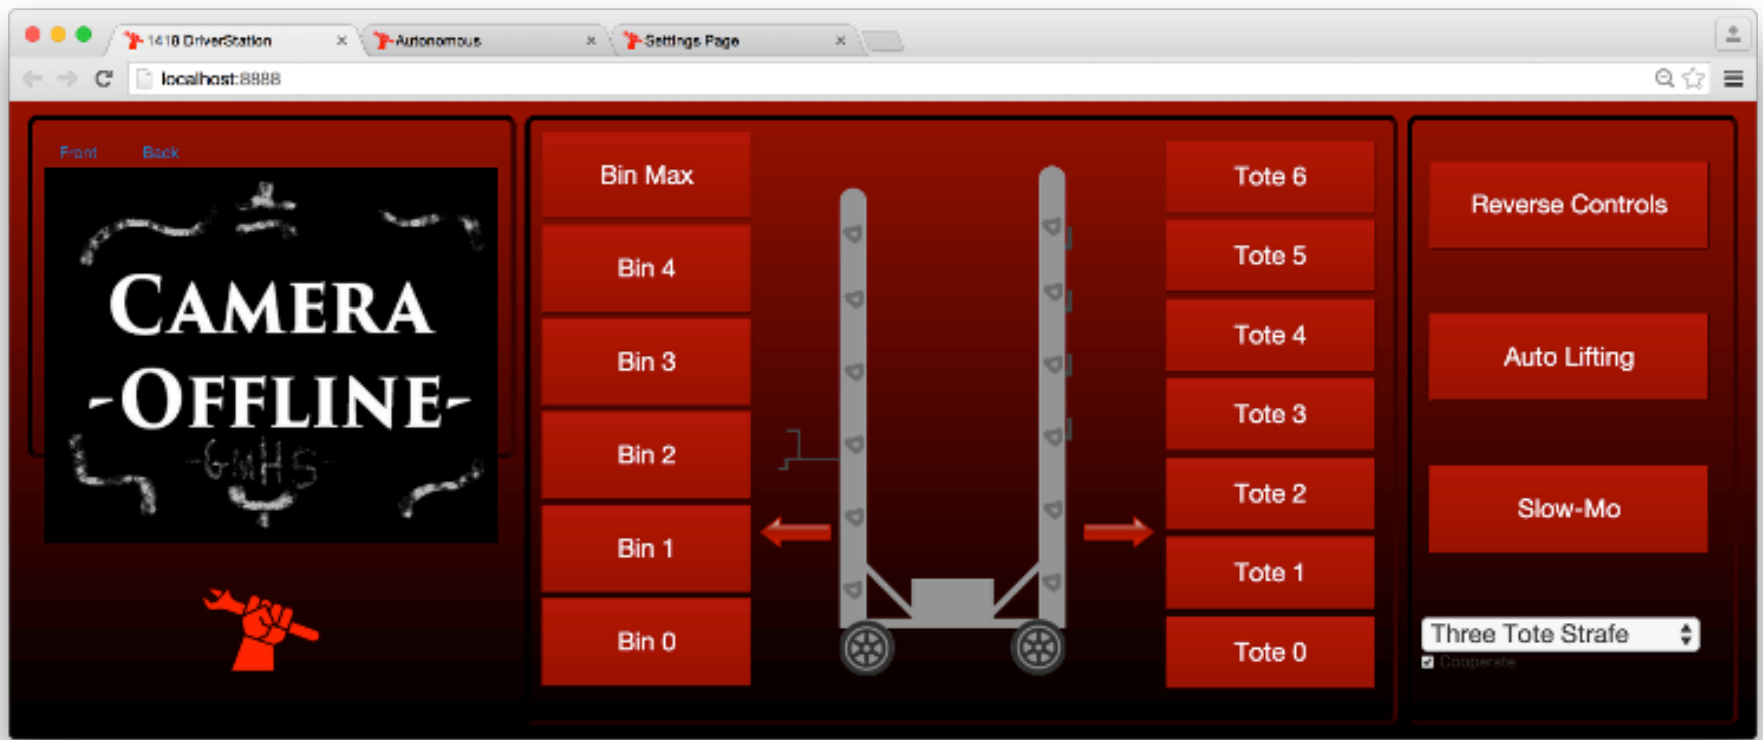

Introducing

**PYNETWORKTABLES2JS**

# My Journey: 2015 - Present

## 2015 UI (Team 1418)

# My Journey: 2015 - Present

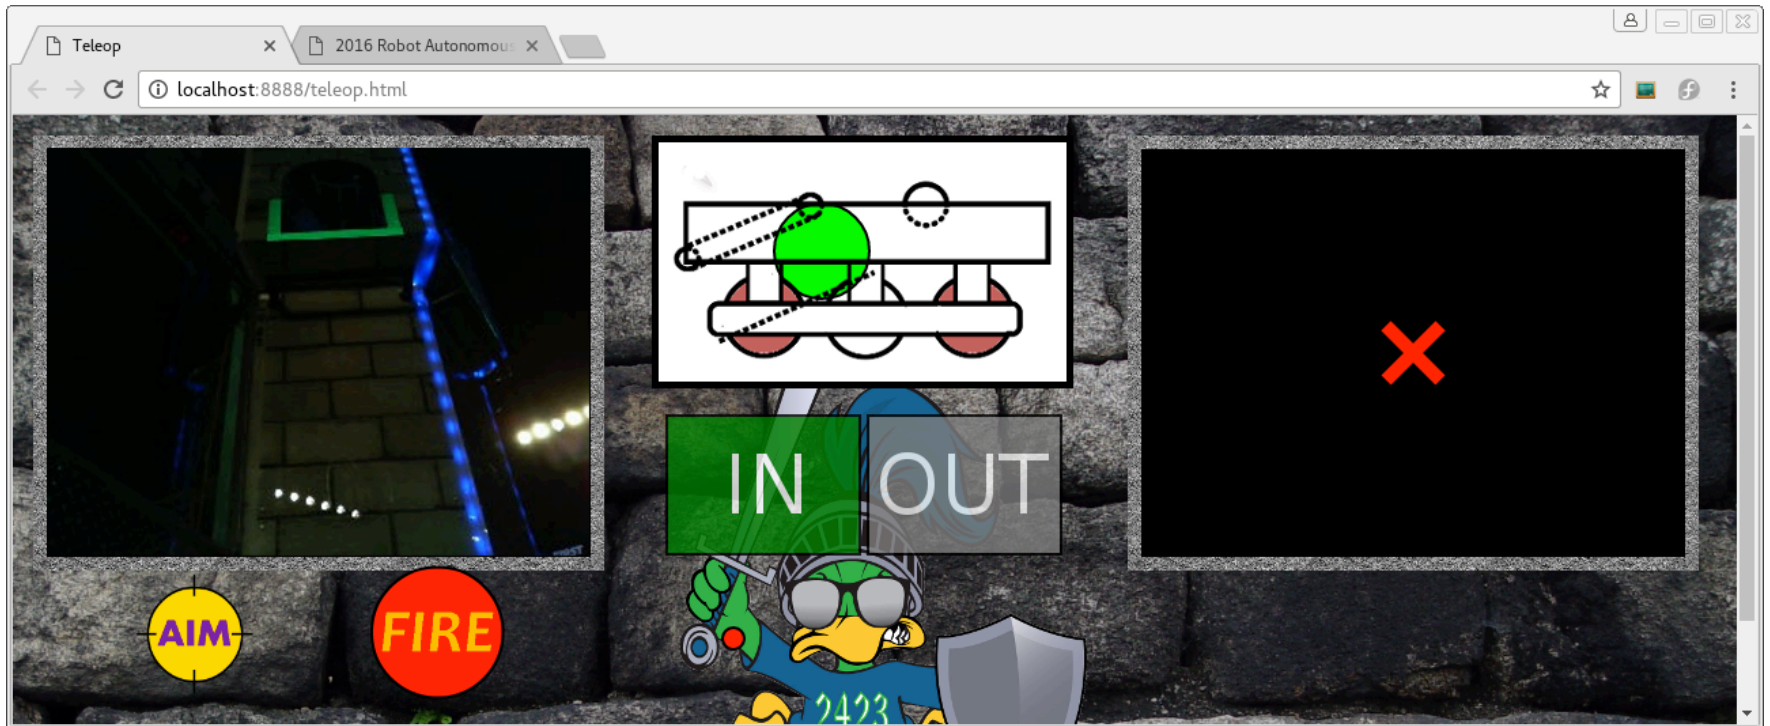

## 2016 UI (Team 1418)

## Interactive camera threshold tuning

### Camera tuner

☒ Processing enabled  
☐ Logging enabled  
☒ Draw Targets  
☒ Draw Threshold

Present: true  
Angle: 3.049999999999997  
Height: -2.1437500000000007  
LogError: false

☐ HUE\_P  
☐ SAT\_P  
☐ VAL\_P

HUE\_N

SAT\_N

VAL\_N

0

145

80

255

255

255

A screenshot of a web-based camera tuner interface. On the left, there's a control panel titled "Camera tuner" with checkboxes for "Processing enabled", "Logging enabled", "Draw Targets", and "Draw Threshold". Below these are sliders for color thresholds: HUE\_P, SAT\_P, VAL\_P, HUE\_N, SAT\_N, and VAL\_N. On the right, a large black rectangular area represents the camera feed. In the center of the feed, a white rectangular object is outlined with a red border, indicating the current threshold settings.

# Why pynetworktables2js

**TL;DR:** It's simpler

pynetworktables2js lowers the barrier of entry for teams that want an additional way to tune/control their robot with a minimal amount of programming.

# Why pynetworktables2js

**TL;DR:** It's simpler

It's as easy as making a webpage.

# Why pynetworktables2js

- Many students already know how to create webpages
  - And if not, there's TONS of ways to learn on the web
- Outreach to nontraditional students
  - Introduce students to programming concepts
  - Artistic students
- Yet another way to learn real world skills

# Why pynetworktables2js

- Very flexible
  - Anything you can do in a webpage
- Simple to get started
- Cross platform
  - Windows + OSX + Linux
- Actually has documentation
  - Unlike most other dashboard alternatives

Let's get started

# HOW IT WORKS

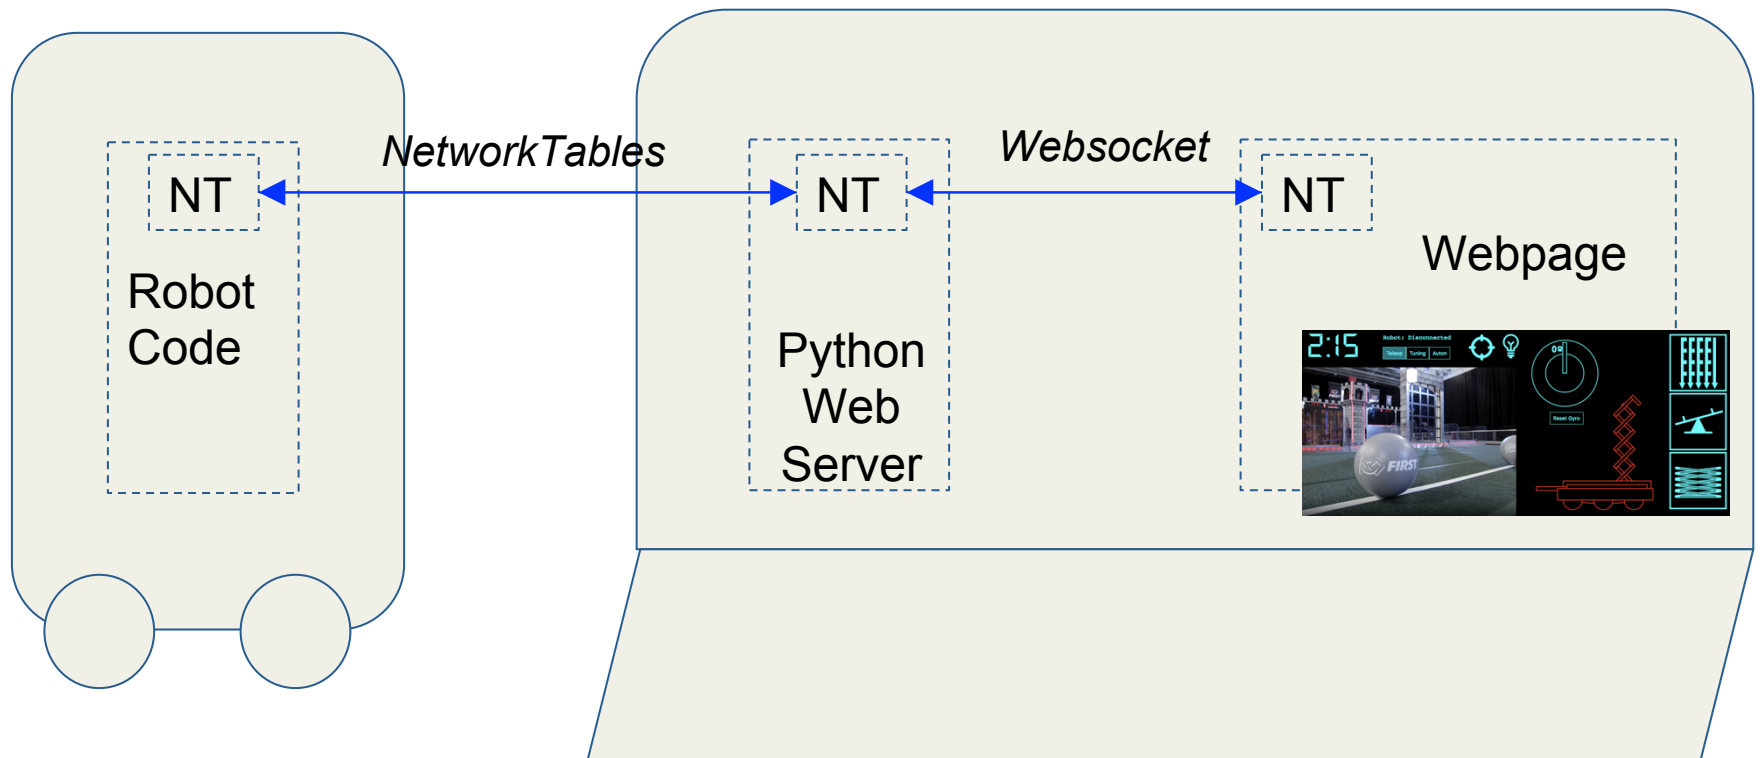

# How it works

- Browser talks to Python server running on your laptop
- Python server uses NetworkTables to communicate with Robot
  - Results are passed back/forth to webpage

# How it works

# How it works

- Note that the webserver runs on the laptop
- You could run it on the robot
  - I don't recommend this because of bandwidth reasons
  - Also, it means you can't load the page until the robot connects to FMS

# NetworkTables

- Easy to use distributed key-value protocol created by WPILib team
- Very little setup required\*
- Latency is “good enough” for 99% of teams
  - pynetworktables is 50ms max

\* mDNS issues in 2016, hopefully they’ll be fixed in 2017...

# NetworkTables Basics

On the server...

```
table.putString("key", "something")
```

On the client...

```
x = table.getString('key')  
  
// output is 'something'  
printf("%s\n", x);
```

# pynetworktables2js Basics

- Very similar to other languages
  - getValue/putValue only
  - Doesn't need getNumber/getString/etc
  - Uses full path of keys, no tables

```
// getValue will return the correct type
var coolThing = NetworkTables.getValue("/table/key");

// putValue doesn't care about what type you pass
NetworkTables.putValue("/table/string_key", "my value");
NetworkTables.putValue("/table/bool_key", true);
NetworkTables.putValue("/table/number_key", 42.0);
```

Let's get started

# **GETTING STARTED**

# Getting Started

- Install pynetworktables2js
  - See the documentation
- Create a directory with web content
- Run the server from inside the directory

**On Windows:**

```
py -m pynetworktables2js
```

**On Linux/OSX:**

```
python -m pynetworktables2js
```

- Point your browser at <http://localhost:8888>

# Your first webpage

```
<!DOCTYPE html>
<html lang="en"><body>

Connected: <span id="connected">false</span>

<!-- Include the API -->
<script src="/networktables/networktables.js"></script>

<script type="text/javascript">

function onConnected(connected) {
    document.getElementById("connected").textContent = connected;
}

NetworkTables.addRobotConnectionListener(onConnected, true);

</script>
</body>
</html>
```

## ***NetworkTables.addRobotConnectionListener(f)***

- Calls a function to tell you that the page is connected to the robot
  - Driver wants to know if the dashboard isn't going to actually do anything!

## ***NetworkTables.putValue(k,v)***

- Sets the value in NetworkTables
  - Give it ~50ms to get to the Robot
- If not connected to robot, value may be discarded

## ***NetworkTables.getValue(k, [default])***

- Returns the current value of a key or null
- I rarely use getValue
  - What happens if the value changes?
  - How do you find out about the change?
- If not connected to robot, value isn't always meaningful

## ***NetworkTables.addKeyListener(k, f, [imm])***

- Set a function that will be called whenever the value for a particular key is changed.
  - It will usually call you when the robot connects, as the values will change
  - If you set the third parameter to true, it will call you immediately with the current value

Putting it all together

**REAL DASHBOARD CODE**

# Putting it all together

- Let's show how to display simple feedback of a digital input
- Here's the steps
  - Create an SVG circle element
  - Add a listener for the value being sent over NetworkTables
  - Change color when the value is received

# Putting it all together

## 1. Include the API in your page

```
<!DOCTYPE html>
<html>
<head>
  <script src="/networktables/networktables.js"></script>
</head>
```

# Putting it all together

## 2. Create an SVG circle element

```
<svg width="100" height="100">  
  <circle id="switch" cx="50" cy="50" r="40"  
    stroke="black" stroke-width="4"  
    fill="gray" />  
</svg>
```

# Putting it all together

## 3. Add a listener for the value being sent over NetworkTables

```
<script type="text/javascript">

function onSwitchChanged(key, value, isNew) {
    // TODO
}

NetworkTables.addKeyListener('/SmartDashboard/switch',
                             onSwitchChanged, true);

</script>
```

# Putting it all together

## 4. Change color upon new value

- **Hint:** Use jQuery to make it easier :)

```
function onSwitchChanged(key, value, isNew) {  
    if (value) {  
        $("#switch").css("fill", "red");  
    } else {  
        $("#switch").css("fill", "green");  
    }  
}
```

Putting it all together

**DEMO**

Putting it all together

# **2015 UI DEMO**

# pynetworktables2js API

- There's lots more...
  - Read the documentation

# pynetworktables2js API

- Useful helper functions for common UI tasks
  - Easy toggle button
  - HTTP Camera support
  - Robot connection indicator
  - SendableChooser related helpers

# pynetworktables2js tips

- Tell your team to buy a touchscreen laptop
  - Very inexpensive these days (<\$700)
- Create multiple pages, and show them using browser tabs
  - One page for teleop
  - One page for autonomous options
  - One page for tuning

# Future work

- pynetworktables2js is a good start...
  - Need more widgets/helpers
  - Single executable deploy for 2017
  - Would love more contributors (hint, hint)
- Need a 'TableViewer' integrated into pynetworktables2js
  - There's a PR on github, needs work

# Future work

- NetworkTables 3.0 support for 2017
  - Enables persistent settings
  - Can talk to LabVIEW
  - Will probably happen...

# Want More?

- This presentation + code available online\*
  - <https://github.com/virtuald/frc-dashboard-workshop>

\* Sometime on Sunday

# FRCDashboard Project

- Created by Erik Boesen, student on 1418
- Uses Electron framework to run HTML/JS app
  - Same thing that Atom text editor uses
- Goal is to provide easy customization and expansion using prebuilt modules
- Project is still very new

# Resources

- pynetworktables2js
  - Code + Examples:  
<https://github.com/robotpy/pynetworktables2js>
  - Documentation:  
<http://pynetworktables2js.readthedocs.io>

# Resources

- 1418's UI repos
  - <https://github.com/frc1418/2015-ui>
  - <https://github.com/frc1418/2016-ui>
- FRCDashboard
  - <http://frcdashboard.github.io/>

# One more thing...

- Publicly editable repository of information related to FIRST Robotics
  - Technical topics
  - Non-technical
  - Team pages
- Add content to your team's page!

<https://firstwiki.github.io>

# Questions
